# Atlas Cables
## Hyper RCA Duo R1 interconnect

**ATLAS CABLES LATEST** high-end RCA interconnect, the Hyper RCA Duo R1 employs a new version of the company's Duo symmetrical 'pseudo-balanced' topology – intended to improve common mode rejection of induced noise currents. Inside each cable the hot and cold conductors are surrounded by their own independent precision-woven OFC screen. At one end, each of the screen pairs is connected to the signal earth in a pseudo balanced connection, making the cable directional. The cable should be connected to the equipment with the arrow pointing away from your preamp.

The conductors are made from a superior grade Ohno Continuous Cast (OCC) stranded copper arrangement for improved conductivity and are insulated in a wideband foamed polyethylene dielectric to offer a high velocity of signal propagation. The RCA connectors are the company's high-quality dark chrome Ultra plugs, which have OFC pins. The Hyper RCA Duo R1 is available in a variety of lengths ranging from 0.5 to 3m.

**OUR VERDICT**
★★★★★

### All aborad!

I kick off listening with John Coltrane's 1958 recording of *Blue Train*, which has a great stereo image with the drums and bass on the right, piano on the left and Coltrane's sax in the centre. The Hyper RCA Duo R1 does a superb job of imparting all of the detail of the recording and the result is amazing realism in my listening room.

With a lovely recording of *Jupiter* from Holst's *The Planets* played by The BBC Symphony Orchestra, there is great power and energy to the performance. I am aware that the instrumental sections of the orchestra are clearly identifiable in my listening room, which really contributes to the fabulous authenticity and realism of this superb recording.

The Hyper RCA Duo R1 is clearly a very well-made interconnect and the RCA connectors are made to a high standard. Overall this is a classy offering capable of transmitting very high-quality sound. ***NR***
